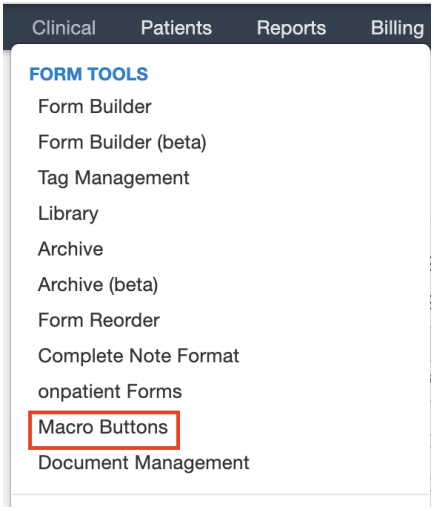
Creating and Using Macros

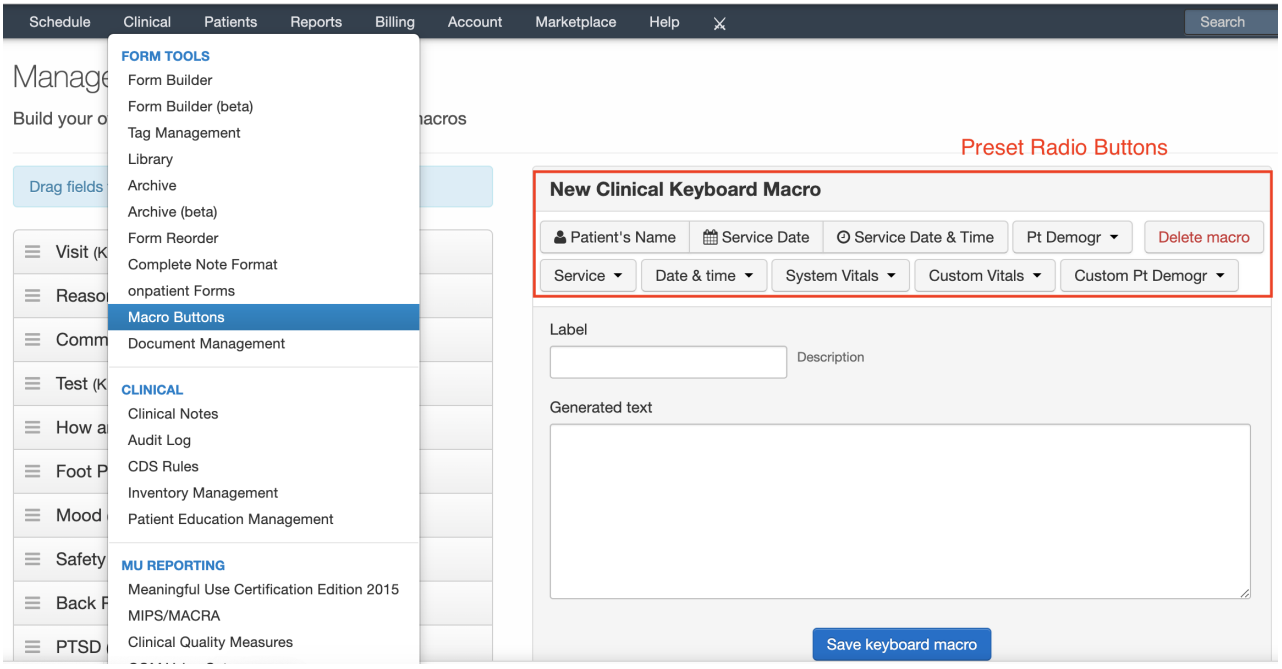
07/08/2024 7:38 pm EDT

Macros can be a great tool to help streamline your workflows and make charting much more efficient. Macros can be used to auto-populate commonly used phrases or notes as well as pull patient information automatically into your Clinical Note.

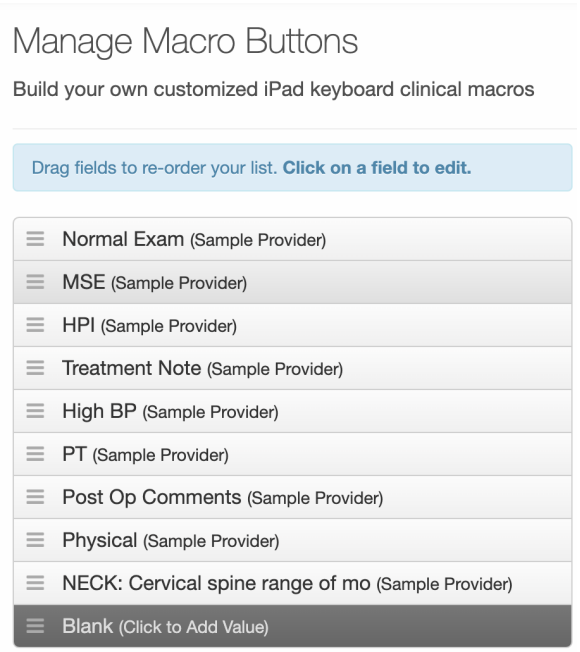
1. To get started with Macros, go to **Clinical** > **Macro Buttons**:



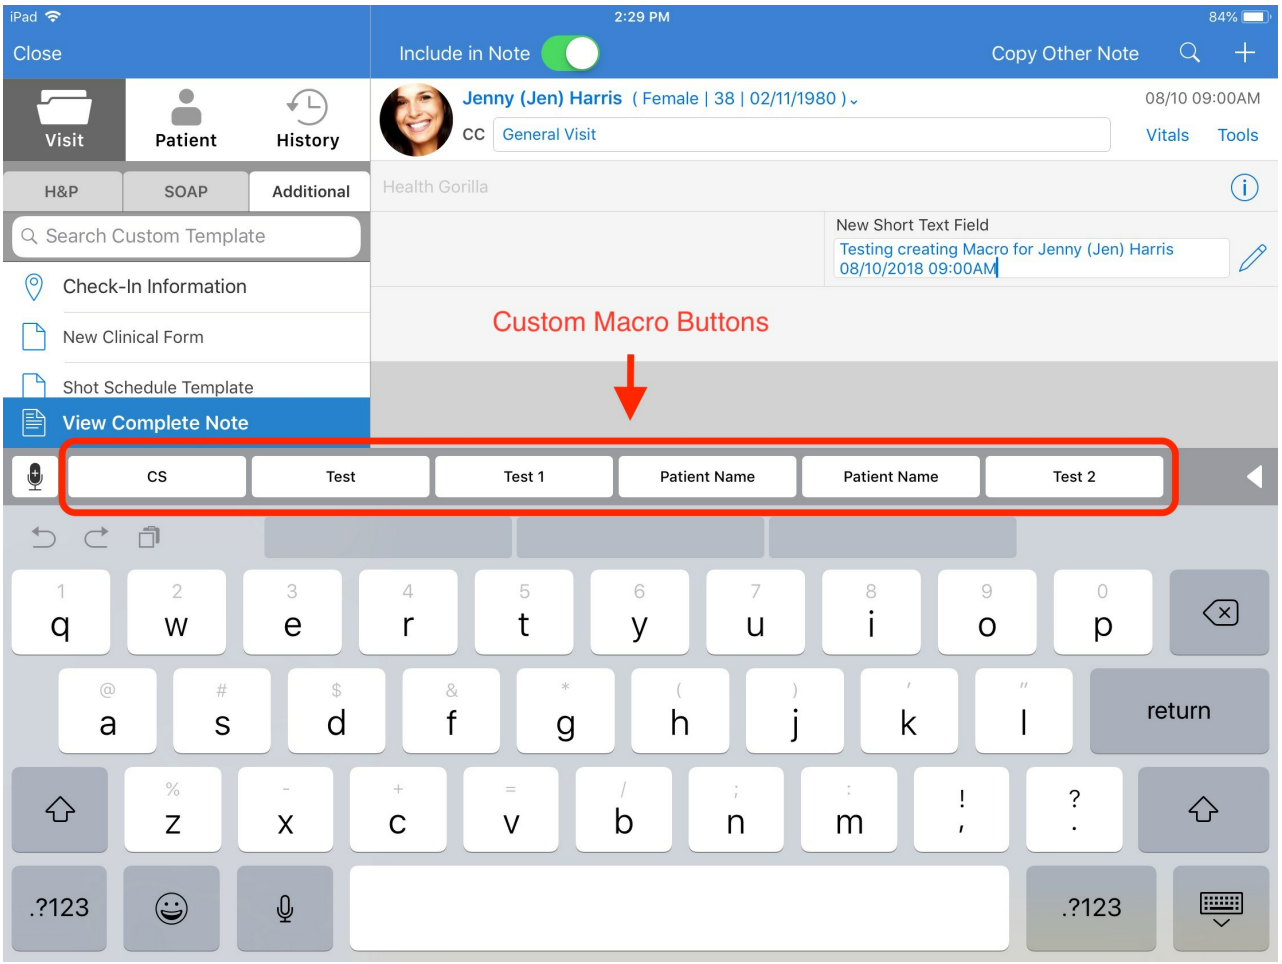
2. To create a new Keyboard Macro, enter a description in the label field and then begin typing desired patient information in the generated text box. You may use the preset radio buttons to enter pre-populated information from the patient's chart. Click **Save keyboard macro** to save the macro for your account.



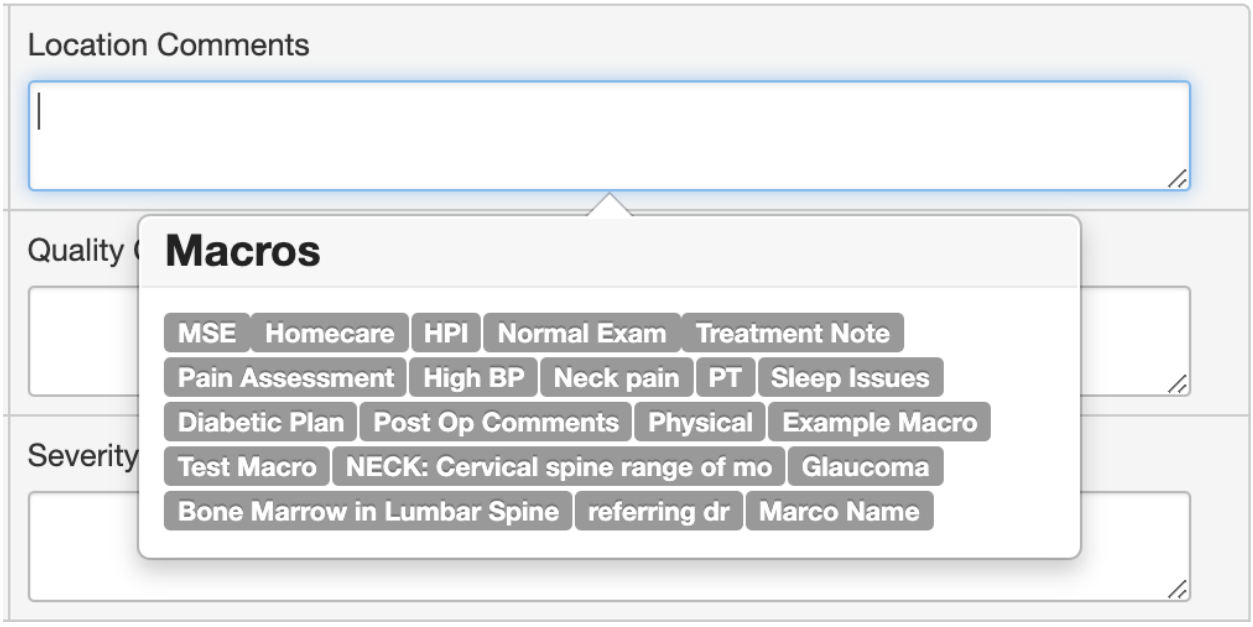
3. Now that you have saved your macro, you should see all of your custom macros listed on the left side of the macros page. You can re-organize your macros by clicking and dragging them in the order you'd like them to appear on your iPad or the web. The provider's name who created the macro appears next to it.



4. While on the iPad: when writing a clinical note, any free text fields will allow you to select a custom macro on your iPad. Selecting a macro will automatically pull in your text:



5. Macros can also be used on DrChrono's web EHR in the clinical note. You have the option to use your macros with the free text fields in your clinical notes on the web.



6. To delete a Macro: From the web go to **Clinical** > **Macro Buttons** select your Macro, and click **Delete macro**.

Note: Macros cannot be recovered once deleted.
