Private vs Public API application

DrChrono Application Programming Interface (API) has two application modes: Private and Public.
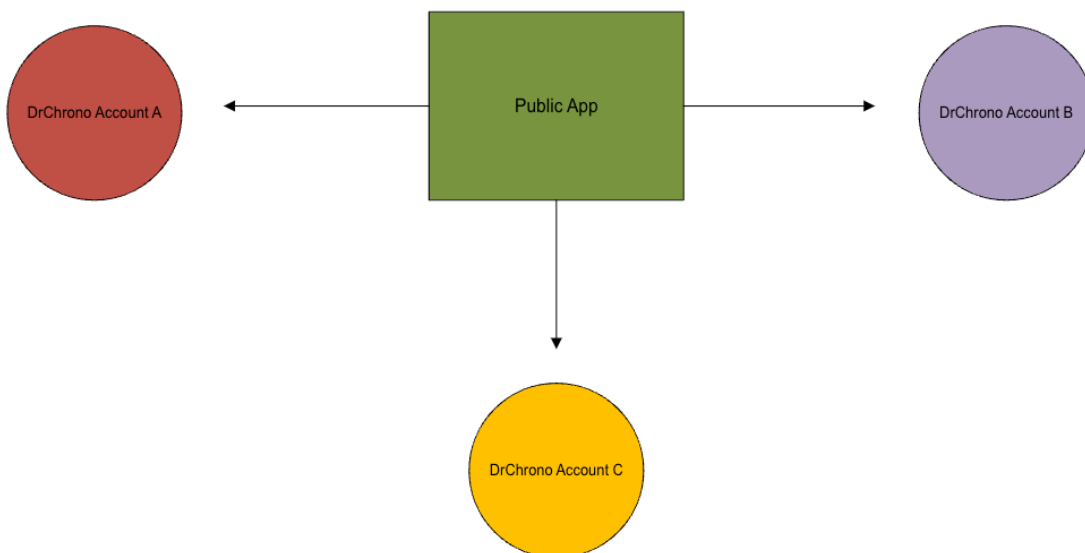

Private API

An API application is defaulted to private mode. A private application can only connect to a user from the same account or practice group. Private mode does not have API/Webhook restrictions besides connecting with users outside the API application's home account.

Public API

Public mode is currently reserved for business partners. This mode is useful for an organization or developer with multiple DrChrono clients. Public API applications can be connected to any DrChrono users outside the public application's home account.

If you are interested in becoming a partner please fill out this form and a member of the DrChrono partnership team will reach out.
